HACKTOBERFEST HACK DAY

HYDERABAD

MLH × NIAT - KKH

OFFICIAL MLH CHALLENGE • 2-HOUR HACK DAY BUILD

BEST OPEN-SOURCE AI PROJECT

Build an original project where open-source or open-weight AI is an important part of how the product works.

BUILD SMALL. MAKE IT WORK. MAKE IT INTERESTING.

120 MINUTES • ONE CLEAR USER STORY • WORKING DEMO

THE PROBLEM

Open AI models and tooling are powerful, but useful developer and community workflows still need to be built. Create a small, real project that puts open-source or open-weight AI at the center of the experience.

01 WHAT COUNTS

- Open-source or open-weight AI must be an important part of the project, not a decorative add-on.
- You may build with an open-weight language model, create an agent skill, or build/adapt an open-source model harness.
- Your project must be published in a public GitHub repository.
- The repository must use an open-source license.
- If you build an agent skill, it must comply with the Agent Skill Open Standard.
- If you submit a model-harness project, include an original implementation or meaningful changes to an existing open-source harness.

A GOOD MENTAL MODEL

OPEN MODEL / OPEN TOOL

↓ **MEANINGFUL PRODUCT LOGIC**

USEFUL OUTCOME

A developer, creator, learner, or community member can use it.

WHAT COULD YOU BUILD?

These are idea igniters, not fixed problem statements. Bring a different idea as long as it satisfies the official challenge requirements.

02 IDEA DIRECTIONS

AI DEVELOPER SIDEKICK

Explain a repository, generate tests, diagnose a bug, summarize an issue, or turn a stack trace into a useful debugging path.

MAKE OPEN SOURCE EASIER

Help contributors discover issues, understand conventions, prepare a contribution, or navigate documentation.

BUILD AN AGENT SKILL

Create a focused reusable skill that gives an agent a concrete capability following the Agent Skill Open Standard.

MODEL-POWERED TOOL

Build an application where an open-weight model is central to the workflow—not merely used to generate code.

IMPORTANT

- Using an AI coding assistant to write your project does not by itself make it an Open-Source AI Project.
- The AI component should be visible in the product architecture and demo.
- Keep the scope narrow: one useful workflow is enough.
- A small project with a clear contribution is easier to demonstrate than a large unfinished platform.

THE 120-MINUTE PLAN

Pick the smallest version of your idea that proves the open-source AI component actually works.

03 BUILD PLAN

TIME	MILESTONE	OUTPUT
00–15	Choose the path	Model / agent skill / harness + one user story.
15–30	Bootstrap	Repo, license, model/tool wired, sample input.
30–80	Build core	End-to-end AI workflow working once.
80–105	Make it useful	Better prompt/schema, validation, UI, errors.
105–120	Ship + demo	Public repo, license, README, 2-minute demo.

JUDGE / DEMO CHECK

- Show the public GitHub repository and open-source license.
- Point to the open-source/open-weight AI component and explain why it matters.
- Run the core workflow live rather than only showing screenshots.
- If it is an agent skill, show the skill being invoked and the useful result.
- If it is a model harness, show what your original implementation or meaningful modification adds.

BUILD OPEN. BUILD USEFUL. MAKE THE AI COMPONENT MATTER.
